Invest in business resilience to bolster cybersecurity in Canada

EY 2023 Global Cybersecurity Leadership Insights Study

Hampered supply chains	Shuttered ecommerce sites	Debilitated infrastructure

are on the rise in as hackers seize vulnerabilities to shut Canadian businesses down.

81%

of Canadian organizations experienced 25 or more cyber incidents and subsequent breaches in the prior 12 months

That is

+8%

more incidents and breaches than their global counterparts experienced during the same period

But only

8%

of Chief Information Security Officers (CISOs) and C-suite execs considered their organization's cybersecurity to be effective today, and well-positioned for tomorrow – far fewer than the 22% of their US counterparts who said the same.

What does it all mean?

Canadian organizations that prepare for worst-case scenarios now have the best possible chance of mitigating costly repercussions when – not if – attacks occur.

How can Canadian organizations strengthen their cyber defences now?

SIMPLIFY
cyber technology stack to reduce risk and improve visibility.

STANDARDIZE
and automate supply chains wherever possible.

COMMUNICATE
the cybersecurity narrative across the organization.

COMBINE
incremental and well-designed training with automation.

DISMANTLE
silos to weave cybersecurity into the organization's fabric.

INVEST
in business resilience.
