Refocusing on the global trade functional organization — a global trade perspective

The EY organization dedicated its 2022 EY Global Trade Focus Day to global benchmarking.

For more than two decades EY has assembled key global trade executives from wide-ranging industries to examine leading practices and evolving strategies of global trade functions. Each participant company is an established global trader with import and export operations in multiple jurisdictions and recognized as an industry leader. In a discussion facilitated by EY professionals, executives described how they coped and adapted amid the rapid changes and how they are now focusing on the future of trade. Our Refocusing on the global trade functional organization — a global trade perspective report summarizes these discussions and findings.

‘Future-proofing’ the customs and trade function

Why now is a critical time for businesses to care about their trade function

Heightened supply chain complexity, increased maturity of regulations and intensified scrutiny from government authorities around the world are testing the trade functions of businesses that move goods internationally. Leaders are asking:

- Is my trade function still fit for purpose?
- What can and should my trade function do to facilitate future business growth?
- How can a trade function do more with the same resources – or even fewer?

In many parts of the world, transformation of trade functions is being seen. If they haven’t transformed already, change is likely right around the corner.

Triggers for companies’ initiatives to (re-)evaluate and transform their trade functions may be a combination of internal and external factors. For example:

- Geopolitical events have led to fast-evolving regulations, such as export control and sanctions, which can cause transport stoppage and brand damage if businesses can’t respond timely and with precision.
- Pressure from cost has always been a challenge, but this has been aggravated by the inflation seen around the world.
- Changing trade blocs, such as major regional free trade agreements (FTAs), while bringing down the cost of trade at face value, is elevating compliance cost and heightening the dependency of niche customs technical capability.
- As companies choose to be leaner and focused on specific sectors or product lines, businesses face the challenge to scale up their customs capabilities following separations and other deals.
- Wider business-level transformations, such as SAP S/4HANA and finance and supply chain transformations, require trade functions to consider their roles in these transformations and what might be possible.
Those are only a few examples of why having a trade function that is fit for purpose and fit for the future should be high on companies’ agendas. These are C-suite implications that are worthy of senior stakeholders’ attention.

What kind of trade function should a business have?

We can jump straight to the answer: There isn’t a universal model – or such thing as a perfect trade function. Any design of functions needs to be aligned with what people want the function to achieve, and it won’t be effective if the function’s objectives are misaligned with the ethos of the wider organization. This is why replicating other companies’ trade function designs may not be a good idea.

The priorities and potential of a trade function

Broadly speaking, trade functions can cover one or more of these responsibilities: operational compliance, tactical planning and strategic business partnering.

The objectives and capabilities of a trade function are not static. For many businesses, it’s a constant balancing act between the focus areas and responsibilities, and some may decide that they don’t even need to focus on strategic partnerships. For those businesses that are considering future states, they may want to map out the ambition in a staged plan.

With operational compliance, businesses work to get the basics right. This is perhaps most commonly seen in organizations when the trade function is involved in the transactional and operational details, interacting with paperwork and customs agents, and acts as the first line of defense when a shipment has an issue at the customs border. KPIs for these functions are usually closely linked with operational KPIs, such as shipment lead time, frequency of delays and customs brokerage cost. Functions that purely focus on operational compliance typically have limited influence over other functions’ processes. As a result, it is not uncommon to see such functions in reactive or “firefighting” mode.

Trade functions that have tactical planning in scope design frameworks and provide enabling tools. They tend to have more independence from and greater influence over other functions’ processes. For example, a tactical trade function in a multinational corporation can involve a centralized team that designs global customs policies and standards that are followed by individual legal entities in their own course of operational compliance. Customs planning, including enhancing the use of available customs reliefs and FTAs, is done at an above-market level. Functions like these usually have targets, such as annual global duty savings and effective duty rates.

For many businesses, tactical planning is a good enough achievement for the trade function. Nevertheless, the world of changes has presented both opportunities and areas for the trade function to do more. Trade functions moving beyond tactical planning have started to think big and act as strategic partners to the rest of the business.

By being a strategic partner to the rest of the business, a trade function may have influence over other functions’ processes or even behaviors. For example, some trade functions partner with sourcing and procurement teams, influencing purchasing decisions by providing full pictures to landed cost. Similarly, these trade functions can deploy customs rules and data to support scenario modeling, such as produce vs. buy decisions in supply chain designs. Trade functions can also play a critical part in environmental, social and governance (ESG), sometimes even managing the potential impact on business continuity. This isn’t an exhaustive list of what trade functions can do – it’s ever-growing.

While it is possible for a trade function to focus on all three areas above, if the basics have yet to be mastered, it will be challenging to get to the strategic state.
How to approach building or transforming trade function

Without commitment at the right level in the organization, it is impossible to achieve fundamental changes and growth of the trade function. To get started, find the appropriate sponsors in the organization. Unfortunately, identifying those individuals is not always straightforward.

Getting senior stakeholders to understand the importance of a fit-for-purpose trade function requires the ability to measure the value of the function in a manner that’s relevant to them. This includes both the current value (i.e., value delivered, protected and maintained by the current function) as well as the potential value a future function can achieve through transformation.

In practice, there are nuances among different industries. For example, trade functions of heavily regulated industries or those with significant social implications (e.g., life sciences) are likely to be subject to different measurements than those where there is less regulation (such as the fast-moving consumer goods sector).

After securing the senior stakeholders’ buy-in, the design of the framework or transformation can look different, depending on the type of trade function. Nevertheless, there are some standard areas that should be examined during a design phase – it’s about having the right people, right process and right technology.

1 ‘Refocusing on the global trade functional organization – a global trade perspective’, EY website. Find it here
If there’s no perfect spot, what about segregating the tasks and functions? For example, in some companies, operational trade compliance is done by the logistics team, and tactical customs activities, such as FTA determination, is done by the tax team. Bifurcating the activities can have many benefits, although the downside is also obvious; the tactical team may not have visibility of what’s being done at a transaction level, therefore failing to provide accurate management reporting on the effectiveness of the policies. Equally, the operational team may struggle to understand rationales behind the tactical team’s decisions, creating inefficiencies and missed opportunities. In our experience, bifurcation is most effective – and perhaps only effective – if a mature ecosystem that promotes communication can be built within the organization.

Process
The first question businesses should ask themselves is: What processes should be in scope of the trade function, and more importantly, what shouldn’t be? We have seen trade functions that desire to be lean and focused on strategic activities deliberately shy away from being involved in business processes (as opposed to customs and trade processes). For these functions, they tend to prioritize the awareness-raising and upskilling of the other business functions, such as embedding standards and working with business partners. The goal is to make operational activities self-sufficient so that the trade function doesn’t have to be involved in the details.

Even within the world of trade processes, there are some processes of a different nature or different consequences that can be managed outside the trade function. For example, some organizations have decided to have sanctions and restricted party screening processes managed and owned by individual countries’ operational teams, separate from the trade functions’ processes, which are focused solely on customs.

It is important for function leaders to avoid being perceived as “empire building” by growing their functions and responsibilities disproportionate to the needs of the business. With the increase of inflation and toughened competitiveness in the market, cost pressure means it is not always possible for personnel to manage every step of all processes. Meanwhile, many organizations are going through wider transformations, such as S/4 HANA, finance and/or supply chain transformation. These business changes are often accompanied by the challenge of how to do more with the same or fewer resources. Outsourcing is a solution that has been tested with many business functions (e.g., tax) for years; it is only natural for the trade function to consider outsourcing as well.

When it comes to outsourcing, many trade functions are nervous, and that anxiety is justified. Afterall, customs and trade are highly specific technical areas that do not have limitless talent pools. However, if deployed appropriately, outsourcing can give organizations a boost of compliance and efficiency, and free up individuals to focus on other tasks. Considerations include:

- When is the right time to consider outsourcing in light of a trade function's level of maturity?
- Which processes and which part of the processes can or should be outsourced?
- Does the business leverage or build a shared service center internally, or are there options for external outsourcing?
- How is visibility and effective control ensured?

This is a complex area, and we will try to explore outsourcing the trade function in more detail in future editions of this publication.

Technology
Technology is another integral aspect of the trade function that affects, and is affected by, people and process. The top reasons we’ve seen for deploying trade-related technology are enhanced compliance and cost optimization achieved through efficiency.
By simplifying or even automating trade processes that would otherwise be done manually, companies can reduce the need for considerable headcounts. For example, rather than managing FTA communication with all suppliers manually, some trade management solutions allow users to request long-term supplier declarations via automated processes. This is particularly helpful for organizations claiming significant FTA benefit that are also relying on many suppliers to provide evidence.

Enhanced compliance speaks for itself, but it also contributes to the goal of managing cost by reducing the likelihood of human errors that could be costly to the business. One of the top technologies most frequently deployed by trade functions is restricted party screening, where the trade content of the software can provide up-to-date information that allows the trade function to process large volumes of transactions in a shorter time frame.

Despite the many benefits, it is important to bear in mind that trade technology is not the solution to all problems, and certainly not just any trade technology. Companies can go wrong if they deploy the wrong technology or assume that the right people and right process can be replaced by technology.

Regardless of how mature the technology or software is, humans still need to make certain decisions. There is always a need for trade professionals who understand their organization to make determinations and filter out the false positives. In addition, we’ve seen many trade functions develop or purchase technology solutions that are disproportionately costly to the benefit, or even ended up being disruptive to the business. Where we have seen the best return on investment is to deploy technology with surgery-level precision – understand the root cause of inefficiency or risks to determine exactly where the problems should be fixed (e.g., in the business process or in the trade process), then choose the technology solution that’s underpinned by the most solid business case.

**Summary**

Historically, trade functions have been regarded as a cost center. This is still somewhat true in many organizations. However, trade functions now face a new normal, where the only certainty is uncertainty. Businesses therefore need to act fast to evaluate whether they have a fit-for-purpose trade function to create strategic value for the business while facing internal and external challenges.

Building a trade function from the ground up can be a very different task than transforming an existing trade function and transforming existing trade functions can be even harder, as it requires changes in legacy processes and even legacy mindsets.

Another consideration for many trade leaders, especially those in the tax function, is what role they should play in the ESG space, given many ESG reporting processes rely on data points that are organically owned by the trade function, and the introduction of green taxes that have a close relationship with cross-border movement.

Businesses have a lot to consider. Different aspects of trade functions will be discussed in more detail in future editions of this publication.

- Global and Editorial contacts
- Americas and Asia-Pacific contacts
EY exists to build a better working world, helping to create long-term value for clients, people and society and build trust in the capital markets.

Enabled by data and technology, diverse EY teams in over 150 countries provide trust through assurance and help clients grow, transform and operate.

Working across assurance, consulting, law, strategy, tax and transactions, EY teams ask better questions to find new answers for the complex issues facing our world today.

About EY Global Trade practices
EY teams bring you a global perspective on Global Trade. The Global Trade EY professionals can help you develop strategies to manage your costs, speed your supply chain and reduce the risks of global trade. They can help to increase trade compliance, improve import and export operations, reduce customs and excise duties and enhance supply chain security. They help you to address the challenges of doing business in today's global environment to help your business achieve its potential. It's how EY teams makes a difference.

TradeWatch is a regular newsletter prepared by EY Global Trade groups. For additional information, please contact your local Global Trade professional.

The views of third parties set out in this publication are not necessarily the views of the global EY organization or its member firms. Moreover, they should be seen in the context of the time they were made.
